

New Manufactured Home Program

Choose
energy right® and rest comfortably, with money
to spare!

Manufactured homes that meet the standards of the *energy right*® program have one important feature in common—an electric heat pump. Weather conditions in the Tennessee Valley are some of the best in the nation for the efficient operation of an electric heat pump, which can save on your heating costs. The heat pump provides uniform heat throughout your home in the winter and cools and dehumidifies your home in the summer. What could be better than having a comfortable home, with money to spare!

New Doesn't Always Mean Energy Efficient

Most manufactured homes come from the factory with a central electric furnace. The cost of central air conditioning is added to the price of the home unless the purchaser specifically requests a heat pump. [TVA](#) works with large-volume heating and cooling equipment contractors to lower the cost of heat pumps, and manufactured-home retailers in the Valley that participate in the *energy right*® program—and most do—can pass those savings on to you. That means that buying a manufactured home in the *energy right*® Program not only lowers your electricity costs for the long term, but it also saves you money up front when you buy your home.

Interested?

Be sure and tell your manufactured home dealer that you want an *energy right*® home with a heat pump, preferably one with a SEER rating of 13. When you purchase a home through the *energy right*® program, you're making the right choice for long-term comfort, quality, value, and savings.

The following local manufactured home dealers participate in the *energy right*® program.

- [Clayton Homes](#)
- Country Squire Homes
- Crossland Homes
- [Dutch Homes](#)
- [Horton Homes](#)
